

## AMENDMENTS TO THE CLAIMS

### Claims

Claims 1 - 30 (Cancelled)

31. (Previously presented) The inner sole of a shoe, comprising:
- a sole base body, defining a sole surface and having a forefoot joint area, a metatarsus/tarsus area, a metatarsus/heel transition area, a heel area, and a plantar arch area;
  - a sole cover layer;
  - a first cushioned layer provided in said forefoot joint area;
  - a second cushioned layer provided in said metatarsus/tarsus transition area; a third cushioned layer provided in said metatarsus/heel transition area,
  - a fourth cushioned layer provided in said heel area, said fourth cushioned area defining a surface which is plateau-shaped and is raised with respect to said sole surface; and
  - a fifth cushioned layer provided in said plantar arch area, said fifth cushioned layer being in the shape of a sickle, wherein:
    - said first, second and third cushioned layers are located at support areas of said sole base body which positively affect a contraction of the musculature of the foot, serving thereby to aid the venous outflow of blood;
    - said first, second and third cushioned layers are each divided into individual plateau-like fields, separated from but positioned next to each other in the transverse direction of said sole surface;
    - each cushioned layer defines a surface, which are each raised with respect to said sole surface;
    - said sole cover layer covering said surface of each cushioned layer and said sole surface; and
    - each cushioned layer is recessed in said sole base body.

Claim 32 (Cancelled).

Claim 33 (Cancelled).

34. (Previously presented) The inner sole as defined in claim 31, wherein: said fourth and fifth cushioned layers are located at support areas of said sole base body which positively affect a contraction of the musculature of the foot, serving thereby to aid the venous outflow of blood.

35. (Cancelled)
